Millennium Centre

Project:

Security system service and maintenance management

Client:

Millennium Centre

Overview:

Wales' Millennium Centre is one of the world's most iconic arts and cultural destinations that plays host to celebrities, world-famous performance artists and millions of visitors each year. Understandably, the building has an extensive, sophisticated security system comprising CCTV, intruder alarm and access control and 24 hour CCTV control room which has to be fully operational 24/7. To achieve this without disrupting any of the events or concerts, the service and maintenance work has to be undertaken around the Centre's performance programme.

The Millennium Centre management appointed CDS due to their proven track record with similarly complex systems, their flexible response times and their general spirit of willingness and co-operation in working around the Centre's exacting requirements.

Project description:

CDS manages the service and maintenance of the whole integrated security system. The highly complex integrated scheme consists of a flexible CCTV management suite; state of the art network based digital recording and sophisticated access control and intrusion detection systems. The different elements are integrated to allow the system to automatically respond and relay information in real time to security officers.

A high speed dedicated network provides excellent quality video and data transmission performance throughout the Centre. The CCTV system features the latest high resolution, internal and external dome cameras, effective in all weather and light conditions. With extremely powerful and accurate zoom lenses, each camera is able to closely monitor and track individuals.

With the system offering total flexibility; operators in the 24 hour control room can use large multi screen video displays to create/monitor security in various areas of the building whilst retaining or restricting access to others.
